1 What Amlodipine tablets are and what they are used for

Amlodipine belongs to a group of medicines called calcium antagonists. It is used to treat:
• high blood pressure (hypertension).
• angina pectoris (pain in the chest caused by blockages in the arteries leading to the heart) or chest pain classed as vasospastic angina pectoris (or Prinzmetal’s (a)ngina).
• severe low blood pressure (hypotension). In patients with high blood pressure, your medicine works by relaxing blood vessels, so that blood passes through them more easily. In patients with angina, Amlodipine tablets works by improving blood supply to the heart muscle, which then receives more oxygen, and as a result chest pain is prevented. Your medicine does not provide immediate relief of chest pain from angina.

2 Before you take

Do not take Amlodipine tablets and tell your doctor if you:
• are allergic (hypersensitive) to Amlodipine tablets, dihydropyridine derivatives, amlodipine or any of the other ingredients (see section 6) or to any other calcium antagonists. This may itching, reddening of the skin or difficulty in breathing
• are in shock including shock caused by heart problems (a condition where your heart is unable to supply enough blood to the body)
• suffer from heart failure after a heart attack
• have severe low blood pressure (hypotension)

Use in children and adolescents

Safety and effectiveness have been studied in 6-17 year old boys and in girls. Amlodipine should only used for hypertension in children and adolescents from 6 years to 17 years of age. Amlodipine has not been studied in children under the age of 6 years. For more information, talk to your doctor.

Usual doses:
- Adults (including the elderly and children 18 years or over): The recommended dose in adults is 5mg a day. The maximum recommended dose is 10mg a day. Patients with impaired liver function: The recommended dose is 5mg a day. Amlodipine 2.5mg is not currently available and the 2.5mg dose cannot be obtained with Amlodipine tablets 5mg as these tablets are not manufactured to break into two equal halves.
- Use in Children and adolescents (6-17 years old): The recommended usual starting dose is 2.5mg a day. The maximum recommended dose is 5mg a day. Amlodipine 2.5mg is not currently available and the 2.5mg dose cannot be obtained with Amlodipine tablets 5mg as these tablets are not manufactured to break into two equal halves.
- Patients with impaired liver function: your doctor may prescribe you a different dose. It is important to keep taking the tablets. Do not wait until your tablets are finished before seeing your doctor.

If you take more Amlodipine tablets than you should:
Taking too many tablets may cause your blood pressure to become low or even dangerously low. You may feel dizzy, lightheaded, faint or weak. If blood pressure drop is severe enough shock can occur. Your skin could feel cool and clammy and you could lose consciousness. Seek immediate medical attention if you take too many Amlodipine tablets.

If you forget to take the Amlodipine tablets:
Do not worry. If you forget to take a tablet, leave out that dose completely. Take your next dose at the right time. Then go on as before. Never double up on the next dose to make up for the one missed.

If you stop taking Amlodipine tablets:
Do not interrupt or stop treatment with Amlodipine tablets without consulting your doctor first. Your doctor could recommend a dose increase if you have any further questions on the use of this medicine, ask your doctor or pharmacist.

Possible side effects
Like all medicines, Amlodipine tablets can have side effects, although not everybody gets them. Visit your doctor immediately if you experience any of the following very rare, severe side effects after taking this medicine:

- Sudden wheeziness, chest pain, shortness of breath or difficulty in breathing
- Swelling of eyelids, face or lips
- Swelling of the tongue and throat which causes great difficulty in breathing
- Severe skin reactions including intense skin rash, hives, reddening of the skin over your whole body, severe itching, blistering, peeling and swelling of the skin, inflammation of mucous membranes (Stevens Johnson Syndrome) or other allergic reactions
- Heart attack (severe chest pain) abnormal heart beat
- Inflamed pancreas, which may cause severe abdominal and back pain, accompanied with feeling very unwell.

The following common-side effects have been reported. If any of these cause you problems or if they last for more than one week, you should contact your doctor.

Common (affects 1 to 10 users in 100):
- Headache, dizziness, sleepiness (especially at the beginning of treatment)
- Palpitations (awareness of your heart beat), flushing
- Abdominal pain, feeling sick (nausea)
- Ankle swelling (oedema), tiredness

Other side effects that have been reported include the following list. If any of these get serious, or if you notice any side effects not listed in this leaflet, please tell your doctor or pharmacist.

Uncommon (affects 1 to 10 users in 1,000):
- Mood changes, anxiety, depression, sleeplessness
- Trembling, taste abnormalities, fainting, weakness
- Numberness or tingling sensation in your limbs/loss of pain sensation
- Visual disturbances, double vision, ringing in the ears (tinnitus)
- Low blood pressure
- Sneezing/running nose caused by inflammation of the lining of the nose (rhinitis)
- Altered bowel habits (diarrhoea, constipation, indigestion), dry mouth, vomiting (being sick).
- Hair loss, increased sweating, itchy skin, red patches on skin, skin disorders
- Disorder in passing urine, increased need to urinate at night, increased number of times of passing urine
- Inability to obtain an erection; discomfort or enlargement of the breasts in men
- Weakness, pain, feeling unwell
- Joint or muscle pain, muscle cramps, back pain
- Weight increase or decrease

Rare (affects 1 to 10 users in 10,000):
- Confusion
- Very rare (affects less than 1 user in 10,000):
- Decreased numbers of white blood cells (Leukocytopenia, thrombocytopenia) which increases the risk of infections, sore throats, nosebleeds, decrease in blood platelets which may result in unusual bruising or easy bleeding (red blood cell damage)
- Excess sugar in blood (thirst, excessive urinating, tiredness, hyperglycaemia)
- A disorder of the nerves which can cause weakness, tingling or numbness (peripheral neuropathy)
- Cough, swelling of the gums
- Abdominal bloating (gastritis)
- Abnormal liver function, inflammation of the liver (hepatitis causing trouble with blood in abdomen, joints or muscles), yellowing of the skin or whites of the eyes (jaundice), liver enzyme increase (detected in blood test) which may have an effect on some medical tests
- Increased muscle tension
- Inflammation of blood vessels (vasculitis), often with skin rash
- Sensitivity to light

Disorder in the nerves which can cause weakness, tingling or numbness (peripheral neuropathy)

Further information
What Amlodipine tablets contain: the active substance is amlodipine (as amlodipine mesilate monohydrate). Each tablet contains either 5mg or 10mg of the active substance.

What Amlodipine tablets look like and the contents of the pack:
Amlodipine 5mg and 10mg tablets are white to off-white, round, biconvex tablets. Pack size: 28.

Marketing Authorisation Holder and Manufacturer:
Actavis, Barnstaple, EX32 8NS, UK.
This leaflet was last revised in June 2012.
